EXPERIMENT – GAME UI/UX DESIGN-CHUNKING, RECOGNITION AND RECALL

GAME TITLE: THIEF RUNNER

Objective: Design and analyze the UI/UX of an endless runner game where the player controls a thief escaping from police while collecting coins and avoiding obstacles. The design focuses on clarity, quick decision-making, feedback, and player engagement.

FRAME 1: INSTRUCTION / START PAGE

Purpose of the Screen: • Introduces the game concept and basic controls. • Prepares the player mentally for fast-paced gameplay. • Reduces confusion before gameplay begins.

Key UI Elements: • Game Title: “THIEF RUNNER” (Bold, large font) • Thief Character Illustration (center) • Short instructions displayed as bullet points • “START RUN” button (highlighted)

Instruction Content:

1. Swipe left or right to change lanes.
2. Swipe up to jump over obstacles.
3. Swipe down to slide under barriers.
4. Collect coins to increase score.
5. Avoid police, walls, and traps.

UI/UX Design Analysis: • Instructions are chunked into short steps for easy understanding. • Icons (← → ↑ ↓) improve quick learning. • High-contrast START button guides the user clearly. • Minimal text avoids cognitive overload.

FRAME 2: GAMEPLAY / RUNNING PHASE

Purpose of the Screen: • Core gameplay where the thief runs automatically. • Tests player reflexes, attention, and decision-making.

Key UI Components: Thief Character (center lane) • Continuous forward motion creates urgency.

1) Police Chaser (background) • Acts as pressure and failure indicator.

2) Coin Counter (Top Right) • Shows collected coins in real time.

3) Score / Distance Meter (Top Left) • Displays how far the player has run.

Obstacles • Walls, barriers, pits, moving objects. • Forces quick reactions (jump/slide/switch lanes).

UI/UX Analysis: • Minimal HUD ensures focus on the road. • Icons instead of text for instant recognition. • Lane-based design simplifies movement decisions. • Visual depth improves speed perception.

FRAME 3: POWER-UP & EVENT PHASE

Purpose of the Screen: • Adds variety and excitement during gameplay. • Rewards skill and exploration.

Power-Ups: Speed Boost – Temporarily increases running speed. Shield – Protects from one collision. Coin Magnet – Automatically attracts nearby coins.

UI Design: • Power-up icons appear glowing and animated. • Timer bar below icon shows remaining duration. • Sound effects reinforce activation.

UX Benefits: • Encourages risk-taking and engagement. • Clear visual feedback avoids confusion. • Short duration maintains challenge balance.

FRAME 4: RESULT / PROGRESSION SCREEN

Purpose of the Screen: • Shows long-term progress and motivation.

Elements: • High Score • Total Coins • Unlockable Thief Skins • Upgrade Options (speed, jump height, magnet duration)

UX Benefits: • Progression system increases retention. • Visual rewards motivate continued play. • Clear stats build player satisfaction.

OVERALL UI/UX PRINCIPLES USED: • Chunking – Information broken into small, clear units. • Visual Hierarchy – Important actions emphasized. • Feedback – Immediate response to player actions. • Consistency – Same icons, colors, and controls throughout. • Gamification – Coins, power-ups, scores, and progression.

Conclusion: The Thief Runner game UI is designed for fast understanding, minimal distraction, and high engagement. Each screen supports the player's goal of escaping, scoring higher, and replaying for improvement.
